English Medieval Industries is an authoritative modern survey of medieval crafts and their products. It is heavily illustrated by pictures of surviving objects and contemporary representations of medieval work. Each industry is approached by material (amongst others stone, tin, lead, copper, iron, brick, glass, leather, bone and wood), discussing its acquisition, working and sale as a finished product. The contributors are the leading experts in their fields. They describe the specialist work that went to make the housing, clothing, tools,

vessels and ornaments of medieval people. A general bibliography provides a valuable reference tool. Innovation in new product development is a key factor in determining the success of a food company yet the area is fraught with risk, with failure rates in excess of 90% being common. Using a series of 12 European cases studies, this book examines the innovation process from agriculture through to retailer. Each example highlights a different aspect of innovation, and the lessons that can be learned from experience. It considers the important role that marketing as well as technical aspects play in the process. Research Paper from the year 2014 in the subject Business economics - Industrial Management, , language: English, abstract: Quick food styles are catching up fast because of a larger number of working couples, domestic fuel crisis, non-availability of reliable domestic servants and breaking-up of joint family system. Neither time nor patience to prepare the ingredients and wholesome food in the house itself, the high price of ingredients and ready-mix are also a significant factor responsible for the spectacular increase in the demand for processed spices products. The processed spices products industry could increase the value of production considerably through the introduction of new variants and hence diversification has also a direct bearing on the product growth. Product Concept Design has been written by a collection of researchers and practising designers from leading companies such as Nokia and Volvo. The book explains the process of conceptual design of new manufactured products and shows how the principles involved are employed in real examples of consumer products from some of the world's most important corporations detailed by the designers themselves. The book will be bought by designers and managers in industry, as well as lecturers in design and design engineering and their students. Today, digital technologies represent an absolute must when it comes to creating new products and factories. However, day-to-day product development and manufacturing engineering operations have still only unlocked roughly fifty percent of the "digital potential". The question is why? This book provides compelling answers and remedies to that question. Its goal is to identify the main strengths and weaknesses of today's set-up for digital engineering working solutions, and to outline important trends and developments for the future. The book concentrates on explaining the critical basics of the individual technologies, before going into deeper analysis of the virtual solution interdependencies and guidelines on how to best align them for productive deployment in industrial and collaborative networks. Moreover, it addresses the changes needed in both, technical and management skills, in order to avoid fundamental breakdowns in running information technologies for virtual product creation in the future. Bee Products and Their Applications in the Food and Pharmaceutical Industries focuses on the health benefits of selected bee products by looking more closely at their pharmacological potentials and therapeutic applications in coping with various diseases. The book explores some of these products, such as royal jelly, propolis and bee venom, which is highly attractive to the food supplement sector due to the biological actions that are proved by scientific studies. Bee products also attract the cosmetics industry by utilizing those products in various applications such as hair products, toothpaste, sunscreen creams, lip balsams, or facial moisturizing creams. Each chapter focuses on a particular health benefit, providing more compact and detailed information about each activity for a specific interest. The mainframe of the book is based on the medicinal and

pharmacological functions of bee products, with the therapeutic applications for each bee product supporting the mechanism of action of their biological functions. Explores bee products such as honey, royal jelly, propolis, bee venom, bee pollen, bee bread, and beeswax health benefits Includes the potential of bee products as a food supplement and cosmetic product Covers the medicinal and pharmacological functions of bee products V.1, A-L [563p.] -- v.2, M-Z [1165p.]. Petroleum-based industrial products have gradually replaced products derived from biological materials. However, biologically based products are making a comeback--because of a threefold increase in farm productivity and new technologies. Biobased Industrial Products envisions a biobased industrial future, where starch will be used to make biopolymers and vegetable oils will become a routine component in lubricants and detergents. Biobased Industrial Products overviews the U.S. land resources available for agricultural production, summarizes plant materials currently produced, and describes prospects for increasing varieties and yields. The committee discusses the concept of the biorefinery and outlines proven and potential thermal, mechanical, and chemical technologies for conversion of natural resources to industrial applications. The committee also illustrates the developmental dynamics of biobased products through existing examples, as well as products still on the drawing board, and it identifies priorities for research and development. This examination of culture in the city provides a discussion of the economic logic and structure of the modern cultural industries. It explores many sectors of the cultural economy, from craft industries to media industries. Biobased Products and Industries fills the gap between academia and industry by covering all the important aspects of biobased products and their relevant industries in one single reference. Highlighting different perspectives of the bioeconomy, EU relevant projects, as well as the environmental impact of biobased materials and sustainability, the book covers biobased polymers, plastics, nanocomposites, packaging materials, electric devices, biofuels, textiles, consumer goods, and biocatalysis for the decarboxylation and decarboxylation of biobased molecules, including biobased products from alternative sources (algae) and the biobased production of chemicals through metabolic engineering. Focusing on the most recent advances in the field, the book also analyzes the potentiality of already commercialized processes and products. Highlights the important aspects of biobased products as well as their relevant industries in one single reference Focuses on the most recent advances in the field, analyzing the potentiality of already commercialized processes and products Provides an ideal resource for anyone dealing with bioresource technology, biomass valorization and new products development This book documents the harmful effects of factory farming in both industrialized and developing countries and explains the range of problems it can cause. From transmission of disease and loss of livestock diversity to hazardous and unsanitary processing methods, it shows clearly why factory farming is an unsafe, inhumane, and ecologically disruptive form of meat production. Also shows how the individual can make a difference by supporting local, organic, or pasture-raised animal products. This book is dedicated to the issues and complexities of industrial services supply chain management. It analyzes how the transition from products to services can be managed, and how supply chains can be adjusted to reflect this new status quo. The book begins with chapters examining product-service systems structures and servitization – the services

infusion process. Next, it presents industrial services as marketing and operations strategy. The focus shifts to service delivery, and this chapter discusses how the actual operations take place. This is followed by an examination of the role of technology and how connected assets are utilized by product vendors in value-creation. The book analyzes the transition from ownership to subscriptions in the pricing decisions chapter. Then the value chain effects chapter offers an overview of the mechanisms through which industrial companies are shortening the distance to end-users and aim for a better position in the value chain. Finally the conclusion addresses theoretical and empirical implications in the industrial services supply chain management. This volume of the IARC Monographs provides an assessment of the carcinogenicity of 18 chemicals present in industrial and consumer products or food (natural constituents, contaminants, or flavorings) or occurring as water-chlorination by-products. The compounds evaluated include the widely used plasticizer di(2-ethylhexyl) phthalate and the food contaminant 4-methylimidazole. In view of the limited agent-specific information available from epidemiological studies, the IARC Monographs Working Group relied mainly on carcinogenicity bioassays, and mechanistic and other relevant data to evaluate the carcinogenic hazards to humans exposed to these agents. Covering the latest technologies in process engineering, this handbook and ready reference features high pressure processing, alternative solvents and processes, extraction technologies and biotransformations -- describing greener, more efficient and sustainable techniques. The result is an expert account of engineering details from lab-scale experiments to large-scale industrial design. The major focus is on the engineering aspects of extraction with organic and supercritical solvents, ionic liquids or surfactant solutions, and is supplemented by aspects of both up- and downstream processing, biotransformation, as well as a survey of typical products in food, pharmaceutical and cosmetic applications. This is rounded off by market developments, economic considerations and regulations requirements in the field. Authored by experts from leading industrial and academic institutions, this is essential reading for the hands-on scientist and office manager alike. The paper investigates the economic effects of major product market reforms in some of the historically most protected non-manufacturing industries. It relies on a unique mapping between new annual data on reform shocks and sector-level outcomes for five network industries (electricity and gas, land transport, air transport, postal services, and telecommunications) in twenty-six countries spanning over three decades. The use of a three-dimensional panel and careful instrumentation of reform shocks using external instruments enables us to control for economy-wide macroeconomic shocks and address possible sources of omitted variable bias more broadly. Using a local projection method, we find that major reductions in barriers to entry yield large increases in output and labor productivity over a five-year horizon, concomitant with a relative price decline. By contrast, there is only a weak positive effect on sectoral employment, and investment is essentially unaffected, suggesting that output gains from reform primarily reflect higher total factor productivity. It takes some time for these gains to materialize: effects become statistically significant two to three years after the reform, as prices start dropping, and productivity and output increase significantly. However, there is no evidence of any negative short-term cost from reform, including under weak macroeconomic conditions. These findings provide a clear case for

intensifying product market reform efforts in advanced economies at the current juncture of weak growth.
