"Vision Quest" puzzles test readers' knowledge. Increasingly, wound management is recognised as a specialised area of practice. Advances in wound-care products, surgical interventions, and social-support options create an often bewildering array of knowledge for healthcare practitioners. This textbook opens with a focus on the core elements of effective wound management: an understanding of how wounds heal and what inhibits wound healing, rigorous assessment, use of outcome measures, evidence-based approaches to practice, and an understanding of how clinical research is done. Key aspects of wound-bed preparation and management - diagnostic investigations, assessment and management of non-viable tissue, infected wounds, dressings and technology, pharmacological therapy, and acute wounds - are then elucidated. Optimal management of commonly-encountered wounds (venous leg ulceration, arterial and mixed arterial-venous ulceration, inflammatory ulcers, pressure injury, and the high-risk foot) and unusual wounds is described. The path to professionalisation of wound management in Australia is charted. The book ends with a list of wound care products (types, properties, uses, distributor-contact details). The editors of and specialist contributors to this text have aimed to build on the foundations provided by the numerous basic, introductory-level textbooks in the field to provide an authoritative, comprehensive, and up-to-date textbook for wound managers who wish to further develop their knowledge and skills. of the skin is impaired, via trauma or surgical incision, wounds and
wound healing are the natural consequences. Thus, every physician
should be interested in the biological processes involved in wound
healing. The physician does not usually interfere with these natural
processes, knowing that the body heals itself (*natura sanat*). It is
not until the natural wound healing process is disturbed, that we
realize how little we know about this area. Our limited knowledge is
not even available to most physicians. Advances in the areas of cell-
and molecular biology have also resulted in substantial progress in
the field of wound healing. Today, we know that the process of
tissue repair occurs in three phases and is controlled by specific
cells. These cells release potent mediators which in turn regulate
the function of other cells surrounding the area. "Certain rules
apply to the healing of wounds and injured tissue. You must follow
nature for nature will never follow you", this sentence written by
Paracelsus in his book "Chirurgia magna" is still valid today. Current
research in wound healing is exploring these rules and integrating
them into new therapeutical concepts. The purpose of this book is
to make current knowledge on basic healing processes, research in
this area and on wound management available to most physicians.
