Zombies are everywhere today and to most people they are something out of scary stories like vampires or werewolves, no more real than Santa Claus or the Easter Bunny. But are we dismissing these blood-thirsty monsters at our peril? According to several scientists who have taken on the task of proving or disproving the possibility of zombies, while it is possible that some previously unknown disease could cause symptoms similar to those associated with pop-culture zombies (a mutated disease similar to rabies perhaps), it is also unlikely. But the actual disaster behind a zombie apocalypse, a deadly global pandemic, is not only possible, it is highly probable. In "Zombie Apocalypse: The Prepper's Guide to Pandemic Outbreak, Quarantine, and Zombie Fallout" #1 Best Selling author Macenzie Guiver shows you how it's happened many times before and why it is likely to happen again during our lifetime. Whether the threat comes from a zombie disease or some errant strain of influenza, the threat of pandemic is real and it is something that every family must be prepared to handle in order to survive. When the 1918 Spanish Flu swept around the globe, entire families and neighborhoods were wiped out. Nearly 30% of the population of the planet were infected as many as 5.5% of the world's inhabitants died as a result (That's more than 1 in every 20 people dead – planet-wide). When the next pandemic comes, the only way to ensure the safety and survival of your family is to prepare now. "Zombie Apocalypse" will help you:

- Understand how pandemics happen, and why we're likely to have another one in your lifetime
- Learn important lessons from past pandemics, and how some of the ones in the recent past make a Zombie outbreak look like child's play
- Know what to expect in the days and weeks following a major outbreak, there's more than just the usual "prepper" stuff to worry about here
- Determine what to do now to be ready, whether it's Zombies, or an uber-deadly new strain of the flu virus there are some common steps to take for this type of "end of the world as we know it" scenario
- Create a pandemic preparedness plan for your family and practice it.

Using the Zombie angle to create your practice scenarios can add a bit of fun to an otherwise difficult and hard-to-wrap-your-head-around prepping topic. From providing an understanding of how pandemics progress from Patient Zero to global catastrophe to explaining how a global pandemic will affect the society around us, this guide provides prepping families with the perspective, information, and planning steps they need to be ready to survive the next pandemic, even if that means fighting off zombies in order to do so! COVID-19 has exposed key gaps in the global community's ability to assess infectious disease outbreaks of international concern, in particular the ability to differentiate between natural and laboratory sources of infection. The purpose of this Occasional Paper is to outline a readily adoptable, stepwise methodology to guide the investigation of corresponding outbreak origins, building upon traditional epidemiological principles. We have sought to remain minimally intrusive at all times; however, an increasing level of need-to-know information, site, and personnel access becomes necessary as attention shifts toward potential laboratory sources. Accordingly, we include recommendations to ensure such access under existing international regimes, primarily the World Health Organization (WHO)'s International Health Regulations. This text gathers the weaknesses revealed during recent infectious outbreaks and organizes them into a guide for combating the trends in emerging infections as they relate to hospital preparedness. As the first book to exclusively explore infectious emergencies, the text begins by reviewing potential pathogens and the clinical issues that may threaten hospital safety before delving into the best operational guidelines for commanding a staff under extreme circumstances, including incident command, communication, transport, maintenance, and a myriad of other topics that can remain manageable with proper protocol. Written by experts in the field, this text is the only one that offers the most effective clinical responses to a crisis at every level of care, including special population, laboratory techniques, care of the deceased, behavioral support, and medical documentation. The text concludes by focusing on the reality of care by introducing true examples from the field and the lessons gained from these cases. Bioemergency Planning is a vital resource for infectious disease specialists, hospitalists, epidemiologists, internal medicine physicians, nurses, social workers, public health officials, and all medical professionals who need to be prepared to respond to an infection outbreak. GIDEON Guide to Cross Border Infections summarizes the status of 3,017 Infectious Disease events which involved two-or-more countries. Charts are designed to quickly scan and compare cross border events according to year, acquisition and origination country, setting, case, deaths and notes with linked references. There are essentially two scenarios for cross-border infection: A traveler or group of travelers from one country acquires infection in another country. An infected or contaminated disease vehicle from one country is responsible for sporadic cases or outbreaks in another country. The vehicle can be an animal, food, cosmetic product, etc. Chapters are arranged alphabetically, by travel related infectious disease, and include: Disease name Disease synonyms Cross Border Events: An overview of the impact of individual diseases as they move through multiple countries Travel-related Incidents: Charts which list details of countries involved, setting, extent and other details of each event. This is one in a series of GIDEON ebooks which explore all individual infectious diseases, drugs, vaccines, outbreaks, surveys and pathogens in every country of the world. Data are based on the GIDEON web application (www.gideononline.com) which relies on standard textbooks and peer-review journals, supplemented by an ongoing search of the medical literature. "The FIORP is intended to be used to coordinate the actions of multiple agencies in response to foodborne illness outbreaks that span more than one Province/Territory (P/T) or involves Canada and another country. The purpose of the FIORP is to set out the key guiding principles and operating procedures for the identification and response to multi-jurisdictional foodborne illness outbreaks in order to enhance collaboration and coordination among partners, establish clear lines of communication, and improve the efficiency and effectiveness of response. It is not intended to provide detailed instructions on how to conduct investigation and response"--Purpose, p. 4. "In the book the authors look at different aspects of preparedness through the lens of the COVID-19 pandemic and the lessons we've learned. Some of the lessons should be obvious by now, but are in danger of being forgotten or de-prioritized when the dust finally settles. Others relate not to technical capabilities that we need, or best practices for public health, but to societal issues that we didn't foresee and which have to be considered in any future outbreak planning. For instance, what does preparedness look like if the federal government takes a strong coordinating role, and what does it look like if states and cities are left largely to fend for themselves (even competing against each other for scarce resources); and how do we plan for a scenario in which the best public health guidance is met with not only skepticism, but outright hostility by a large swathe of the country? The book offers concrete and conceptual guidance, but in doing so also asks difficult questions"-- The My Physician association is composed of top medical professionals who have come together with the goal of educating the public on critical health issues. Herpes is a sexually transmitted disease that you have for a lifetime since it can never be cured. That said however, having herpes does not mean a death sentence for those persons who are suffering from it. This is so for the reasons that there are many treatment options for the symptoms that accompany this disease and if you maintain great health, have a properly functioning immune system and limit your intake of alcohol and increase you consumption of anti-herpes foods, then you can greatly diminish the number of herpes outbreaks that you do have and you may even be able to avoid having any of the symptoms that are associated with the herpes virus. The other great news for those individuals who have this disease is that some of the treatments options that are available to you are home remedies, which mean that there will be no side effects at all for you to deal with and these home remedies work as faster and sometimes even faster, and are also very effectual as well. Of great importance to persons who have herpes, the time when they are most contagious is when they are having an outbreak and cold sores are present. When these cold sores break and leak the fluid that is contained inside, this is when the cold sores are at their most contagious. When you are having an outbreak and have cold sores, you should avoid sexual contact; both sexual intercourse as well as kissing, as the virus can be transmitted from one person to the next this way.
