This book disseminates the latest results and envisages new challenges in the application of mathematics to various practical situations in biology, epidemiology, and ecology. It comprises a collection of the main results presented at the Ninth Edition of the International Workshop "Dynamical Systems Applied to Biology and Natural Sciences - DSABNS", held from 7 to 9 February 2018 at the Department of Mathematics, University of Turin, Italy. While the principal focus is ecology and epidemiology, the coverage extends even to waste recycling and a genetic application. The topics covered in the 12 peer-reviewed contributions involve such diverse mathematical tools as ordinary and partial differential equations, delay equations, stochastic equations, control, and sensitivity analysis. The book is intended to help both in disseminating the latest results and in envisaging new challenges in the application of mathematics to various practical situations in biology, epidemiology, and ecology. 9 lectures, Dornach, December 24, 1922 - January 6, 1923 (CW 326) "Modern science, and the scientism based on it, so far from being the only possible 'reality principle' is merely one way of conceiving the nature of reality; a way moreover that has

arisen only recently and which there is no reason to suppose will last forever."

--Owen Barfield (from the introduction) These talks outline the subtle changes in our ideas and feelings in relation to the development of natural science. Through this, Steiner shows the significance of scientific research and the mode of thinking that goes with it. As we look at what technology has brought us, we may have a feeling like the pain we feel over the death of a loved one. According to Steiner, this feeling of loss will eventually become our most important stimulation to seek the spirit. This book is a translation from German of *Der Entstehungsmoment der Naturwissenschaft in der Weltgeschichte und ihre seitherige Entwicklung* (GA 326). This book covers a course of mathematics designed primarily for physics and engineering students. It includes all the essential material on mathematical methods, presented in a form accessible to physics students, avoiding precise mathematical jargon and proofs which are comprehensible only to mathematicians. Instead, all proofs are given in a form that is clear and convincing enough for a physicist. Examples, where appropriate, are given from physics contexts. Both solved and unsolved problems are provided in each section of the book. *Mathematics for Natural Scientists: Fundamentals and Basics* is the first of two volumes. Advanced topics and their applications in physics are covered in the second volume.
